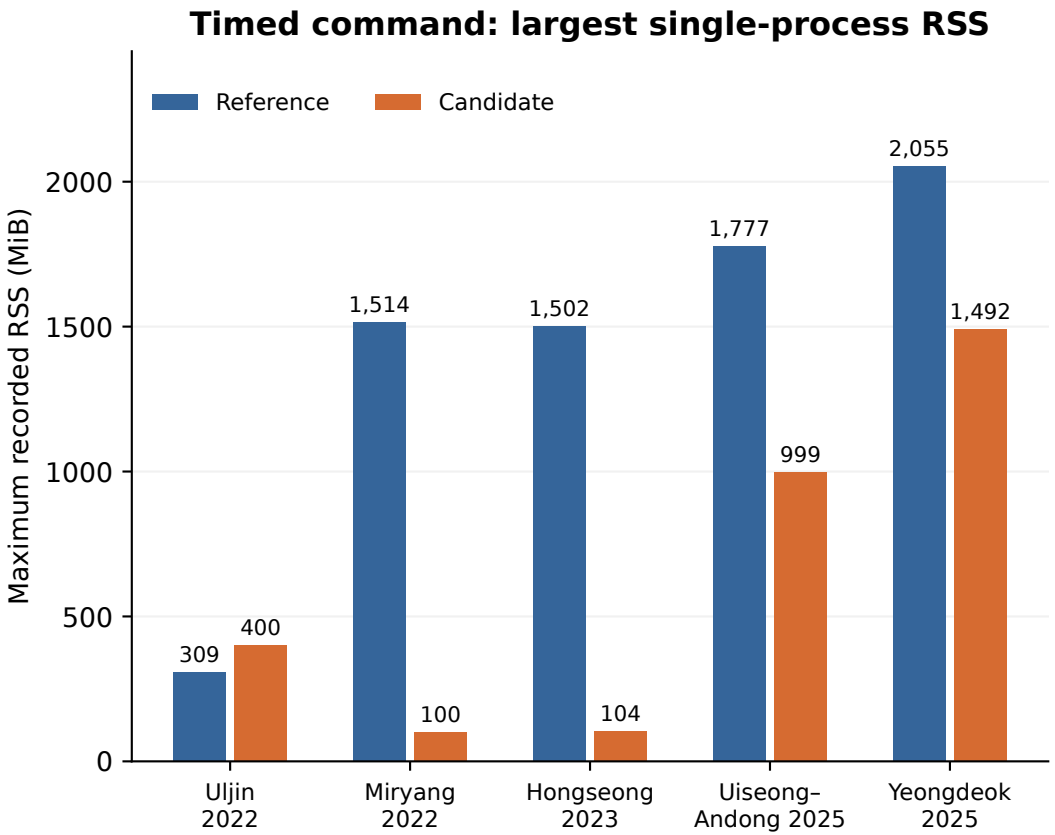
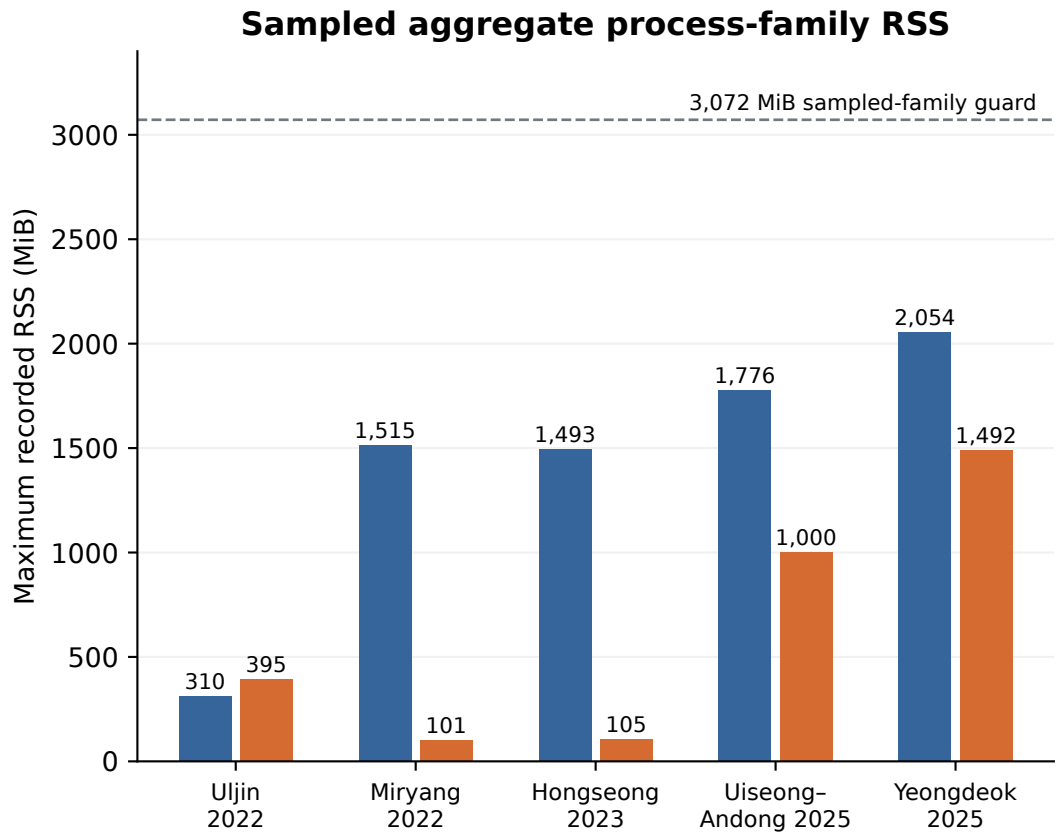
Memory measurements retain their process scope

All recorded attempts, eight per regional group / arm • MiB = 2^{20} bytes • separate measurements are not interchangeable





Largest-process maxima: reference 2,054.547 MiB; candidate 1,492.172 MiB. Sampled-family maxima: 2,054.141 / 1,491.563 MiB.
Across 40 exact-input pairs, the median candidate − reference largest-process difference is +9.844 MiB. Lower panel maxima do not imply universal per-pair memory savings.
