Route search and checking under a frozen contract

Illustrative current-law workflow • latest c651 inputs / kit v3 • not a measured trajectory

1 Bind inputs and admission

Forecast, scenario, graph and clock identities
Native masks and zero policies
Origin, supplied history and mission requirements

2 Search timed journeys

Legal road motion, turns and waits
Time / incoming-edge state and scenario dose
Witnesses and bounded search stages

3 Check the full journey

Flame contact, peak flux and dose
Incurred exposure and destination dwell
Runtime road certificate gates publication

4 Record every outcome

Route or scoped refusal; rejected check
Timeout, unsupported, late and interrupted
Owned-process and complete-cost receipts

5 Independent checks within scope

Trajectory and exact whole-road flame contact
Cell-centre exposure and optimum / refusal
Road radiation samples are diagnostics

6 Report within evidence scope

Exact source / input / result binding
Resolution, routes and refusal denominators
Preserve failures and unresolved claims

Research outcome = recorded result + process receipt + independent check scope

Resolved is conditional on the declared model. Runtime road certificates come from the software under test.
This independent review does not establish a continuous-road radiation enclosure, global proof or physical safety.

Sources: retained routing contracts and exact latest packet / queue reviews (ledger).
